

The fuzzy anomaly rule covers entropy's blind spot

44 cells (4 models x 13 templates), fixed configuration for both detectors so neither gets a search budget. Template is constant within a cell and length is matched. The relationship survives a split-half check for the shared-term artefact ($r = -0.78 / -0.72$ on disjoint seeds), and $\text{corr}(\text{entropy}, \text{FIS})$ is only $+0.22$.
