

Negative results — the fuzzy rule's advantage was a confound

Left: each control added moves the fuzzy rule down and the confidence baselines up. Right: against the SAME fabrications, the fuzzy rule is at chance with a broad truthful set — so the earlier 0.906 was prompt-family style, not fabrication. Shrinking the fit set costs only -0.028 .

A · Adding controls reverses the ranking

B · Same fabrications, different truthful set
